Learning Style Response

After taking the Learning Styles Assessment, I received scores of 35% Auditory, 40% Visual, and 25% Tactile. The website, in turn, labelled me as a purely Visual learner. While this was not much of a surprise for me since I have always had an inclination towards visual stimulation, I was actually very surprised at how close of a percentage Auditory learning was to Visual learning for me. When I thought about it, however, it did make sense to me as to why those two measurements were so close together; I had never really noticed how much I use sound as a learning device until taking the assessment. I realized while looking through some of the questions that I use my ears sometimes and I don't even realize it, and it became clear why I had never thought of Auditory as an efficient learning style for me; I realized I am dominated by my vision. I let my sight control almost all of my life; colors, events, shapes, forms, these are always being processed by me with a lot of weight. I'm always analyzing what I see as I see it, whereas when I use my hearing I usually take on a more instinctive air. I am very glad I was able to realize this through taking the assessment, because now I feel that since I know my vision and hearing are about equal in terms of how I utilize them in learning I can experiment with melding them together to learn in new and invigorating ways.

*Attached are my assessment results
